Semantic Similarity Context Ambiguity

Semantic similarity

- Most work on semantic similarity relies on the DISTRIBUTIONAL HYPOTHESIS (Harris 1954)
 - Take a word and its contexts:
 - tasty klemenrak
 - sour klemenrak
 - a bottle of *klemenrak*
 - klemenrak gone bad
- By looking at a word's context, one can infer its meaning
- Computationally: vector space model

伺▶ 《 ≧ ▶

- By looking at a word's context, one can infer its meaning
- Computationally: vector space model

Semantic Similarity Context Ambiguity

Two kinds of context

- a window around the word is used as context
- e.g. a fixed numbers of words, the paragraph in which a word appears, . . .
- often used with some form of dimensionality reduction
- 'topical' similarity
- Syntactic context
 - a corpus is parsed, dependency triples are extracted
 - $\bullet\,$ e.g. $\,$ <apple, obj, eat>, <apple, adj, red> \,
 - typically does not use any form of dimensionality reduction
 - tighter, synonym-like similarity

・ロト ・回ト ・ヨト ・

Semantic Similarity Context Ambiguity

Ambiguity

• Problem: ambiguity

- Compare:
 - a trendy bar
 - $\leftrightarrow \textit{ an iron bar}$
 - \leftrightarrow today's air pressure: 1.013 bar
- Different meanings, but they are considered the same entity by a naive algorithm
- Main research question: can 'bag of words' context and syntactic context be combined to differentiate between various senses of a word?

<ロ> <同> <同> <三>

Introduction Non-Negative Matrix Factorization Methodology Extending NMF Results Sense subtraction Conclustering Extension

Technique

• Given a non-negative matrix V, find non-negative matrix factors W and H such that:

$$V_{n\times m} \approx W_{n\times r} H_{r\times m} \tag{1}$$

・ロト ・回ト ・ヨト

- Choosing $r \ll n, m$ reduces data
- Constraint on factorization: all values in three matrices need to be *non-negative values* (≥ 0)
- Constraint brings about a *parts-based* representation: only additive, no subtractive relations are allowed

Non-Negative Matrix Factorization Extending NMF Sense subtraction Clustering Extension

Results

- Context vectors (5k nouns × 2k co-occurring nouns)
- NMF is able to capture 'semantic' dimensions
- Examples:
 - *bus* 'bus', *taxi* 'taxi', *trein* 'train', *halte* 'stop', *reiziger* 'traveler', *perron* 'platform', *tram* 'tram', *station* 'station', *chauffeur* 'driver', *passagier* 'passenger'
 - bouillon 'broth', slagroom 'cream', ui 'onion', eierdooier 'egg yolk', laurierblad 'bay leaf', zout 'salt', deciliter 'decilitre', boter 'butter', bleekselderij 'celery', saus 'sauce'

・ロト ・回ト ・ヨト

Introduction Non-Negative Matrix Factorization Methodology Extending NMF Results Sense subtraction Conclusion Clustering Extension

Methodology

- Goal: classification of nouns according to both 'bag of words' context and syntactic context
- → Construct three matrices capturing co-occurrence frequencies for each mode
 - nouns cross-classified by dependency relations
 - nouns cross-classified by (bag of words) context words
 - dependency relations cross-classified by context words
- $\bullet \Rightarrow \mathsf{Apply} \ {}_{\mathrm{NMF}}$ to matrices, but interleave the process
- Result of former factorization is used to initialize factorization of the next one

 Introduction
 Non-Negative Matrix Factorization

 Methodology
 Extending NMF

 Results
 Sense subtraction

 Conclusion
 Clustering Extension

Sense subtraction

- 'switch off' one dimension of an ambiguous word to reveal other possible senses
- Matrix *H* gives the importance of each dependency relation given a dimension
- 'subtract' dependency relations that are responsible for a given dimension from the original noun vector

•
$$\overrightarrow{v}_{new} = \overrightarrow{v}_{orig} (\overrightarrow{1} - \overrightarrow{h}_{dim})$$

• each dependency relation is multiplied by a scaling factor, according to the load of the feature on the subtracted dimensions

Non-Negative Matrix Factorization Extending NMF Sense subtraction Clustering Extension

Combination with clustering

- A simple clustering algorithm (K-means) assigns ambiguous nouns to its predominant sense
- Centroid of the cluster is fold into topic model
- The dimensions that define the centroid are subtracted from the ambiguous noun vector
- Adapted noun vector is fed to the clustering algorithm again

<177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177 < 177

Experimental Design Dimensions Examples Evaluation

Experimental Design

- Approach applied to Dutch, using Twente Nieuws Corpus (\pm 500M words)
- Corpus parsed with Dutch dependency parser ALPINO
- three matrices constructed with:
 - 5k nouns \times 40k dependency relations
 - 5k nouns \times 2k context words
 - 40k dependency relations \times 2k context words
- Factorization to 50 dimensions

	rec.	60.23	52.45	41.80	

Conclusion Future Work

Conclusion

- Combining bag of words data and syntactic data is useful
 - bag of words data (factorized with NMF) puts its finger on topical dimensions
 - syntactic data is particularly good at finding similar words
 - a clustering approach allows one to determine which topical dimension(s) are responsible for a certain sense
 - and adapt the (syntactic) feature vector of the noun accordingly
 - subtracting the more dominant sense to discover less dominant senses
- Algorithm scores better with regard to precision; lower with regard to recall

Conclusion Future Work

Future Work

- Evaluate the method with other evaluation frameworks (focus on ambiguous nouns, Cornetto Database)
- Work out proper probabilistic framework for 'subtraction' of dimensions
- Use the results of the method to learn selectional preferences, in order to improve parser performance
